

YENKASA CLEANUP AND YENKASAAI INGESTION WORK LOG

Date: 2026-06-04

Scope

This document records the cleanup and verification work done after the YenkaSAI Flutter/backend files were found inside the YenkaSA Kotlin app repository.

Correct Folder Boundaries

- /Users/kofibright/yenkasaChat
 - Kept as the YenkaSA Kotlin app repository plus yenkaSAChatBackend/RegLoginBackend.
 - Kept OIL and YenkaSAI bridge backend code in yenkaSAChatBackend/RegLoginBackend.
 - Removed misplaced duplicated project folders from this repo.
- /Users/kofibright/StudioProjects/YenkaSAi
 - Treated as the real YenkaSAI Flutter frontend repository.
 - All Flutter PDF ingestion UI changes were applied here.
- /Users/kofibright/Desktop/YenkaSAi alias
 - Confirmed as a macOS shortcut/alias, not the real working tree.
- /Users/kofibright/Desktop/yenkasa_ai_flutter
 - Confirmed as a plain folder, not the real git repo.
 - Not used as the target Flutter project after confirmation.

YenkaSAChat Repository Cleanup

Removed these misplaced folders from /Users/kofibright/yenkasaChat:

- yenkaSA-ai
- yenkaSA_ai_flutter

Removed the old static React/YenkaSAI web bundle from the backend because YenkaSAI web will be generated from Flutter instead:

- yenkaSAChatBackend/RegLoginBackend/public/yenkasa_ai

Kept the backend API/OIL bridge files under:

- yenkaSAChatBackend/RegLoginBackend/src/ai
- yenkaSAChatBackend/RegLoginBackend/src/intelligence
- yenkaSAChatBackend/RegLoginBackend/src/server.js

Backend/OIL Bridge Work Kept

Files involved:

- yenkasaChatBackend/RegLoginBackend/src/server.js
- yenkasaChatBackend/RegLoginBackend/src/ai/providers/fastapi.provider.js
- yenkasaChatBackend/RegLoginBackend/src/intelligence/services/eventPublisher.service.js
- yenkasaChatBackend/RegLoginBackend/src/intelligence/services/serverIncidentOil.service.js
- yenkasaChatBackend/RegLoginBackend/tests/intelligenceEventPublisher.test.js

Purpose:

- Allow server incidents and operational logs from server.js to be normalized as OIL/intelligence events.
- Keep YenkasaAI relay behavior in the app backend.
- Add test coverage for server incident log normalization.

YenkasaAI Flutter Work

Real Flutter repo:

- /Users/kofibright/StudioProjects/YenkasaAi

Files changed:

- pubspec.yaml
- pubspec.lock
- lib/features/chat/data/ai_api_service.dart
- lib/features/ingestion/presentation/ingestion_page.dart
- test/widget_test.dart
- macos/Flutter/GeneratedPluginRegistrant.swift
- macos/Podfile.lock
- ios/Podfile.lock

Implemented:

- Added file_picker dependency.
- Added IngestionUploadResult.
- Added AiApiService.uploadKnowledgePdfs.
- Wired the ingestion page button to select PDF files.
- Uploads selected PDFs as multipart form data to /ingest.
- Shows selected file names.
- Shows upload success summary.
- Shows upload errors.
- Updated stale widget test so it renders GetStartedPage directly instead of waiting on router/bootstrap animations.

Clean Build Procedure

The first Android and macOS release builds were treated as stale because they were produced before flutter clean.

Then the clean procedure was run:

- flutter clean
- flutter pub get
- flutter analyze
- flutter test
- flutter build apk --release
- flutter build macos --release
- flutter build ios --release --no-codesign

Verification Evidence

Backend syntax checks passed:

- node --check src/server.js
- node --check src/intelligence/services/eventPublisher.service.js
- node --check src/intelligence/services/serverIncidentOil.service.js
- node --check src/ai/providers/fastapi.provider.js

Backend event publisher tests passed:

- Command: node --test tests/intelligenceEventPublisher.test.js
- Result: 9 tests passed.
- Covered: server incident logs, notification lifecycle events, community post notification events, livestream operational events, retry delay, relay payload mapping, and event normalization.

Flutter verification passed:

- flutter analyze
 - Result: No issues found.
- flutter test
 - Result: All tests passed.

Clean release builds passed:

- Android release APK:
 - build/app/outputs/flutter-apk/app-release.apk
 - Size: 57.6 MB
- macOS release app:
 - build/macos/Build/Products/Release/YenkasaAi.app

- Size: 51.5 MB
- iOS release app:
 - build/ios/iphoneos/Runner.app
 - Size: 25.4 MB
 - Built with --no-codesign; manual signing is still required before physical device deployment.

Build Warnings Observed

- Android build emitted Java source/target 8 obsolete warnings.
- macOS build emitted flutter_tts Swift future-compatibility warnings for AVSpeechSynthesisVoiceQuality and AVSpeechSynthesisVoiceGender.
- iOS build warned that code signing was disabled, which is expected for --no-codesign.

Current Expected Git Status Summary

In /Users/kofibright/yenkasaChat:

- Deleted misplaced duplicate folders:
 - yenkasa-ai
 - yenkasa_ai_flutter
- Deleted old static YenkaSAI web bundle:
 - yenkasaChatBackend/RegLoginBackend/public/yenkasa_ai
- Kept backend/OIL bridge modifications under yenkasaChatBackend/RegLoginBackend/src.

In /Users/kofibright/StudioProjects/YenkasaAi:

- Flutter PDF ingestion wiring is present.
- Dependencies are restored after clean.
- Release artifacts were built from clean output.

Notes

- The old React/YenkasaAI static web app inside RegLoginBackend/public/yenkasa_ai was removed because the future YenkaSAI web app will be built from Flutter.
- The backend /api/yenkasa-ai bridge code remains because it is not the old web frontend bundle.
- The iOS artifact is not device-installable until signed.
